HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

DETAILED ACTION

Allowable Subject Matter

Claims 13-19 and 21- 27 are allowed.

The following is an examiner's statement of reasons for allowance:

With respect to claims 13 and 24, the prior art of record does not explicitly disclose or render obvious an image projection unit comprising: an image generation element arrangement configured to produce an image by using the primary illumination light or a derivative of the primary illumination light and to generate secondary illumination light, the image generation element arrangement comprising an electronic switchable color filter and configured to transmit at least one first spectral component of incident light, to avoid transmission of a complementary spectral range of the at least one first spectral component, and to controllably switch a wavelength of the at least one first spectral component and the complementary spectral range of the at least one first spectral component.

The closest prior art of record, O'Connor, describes a color switch (16) of Figure 1 that "may ideally pass red light through, for example, and selectably switch or alternate between either passing blue light and reflecting green light or passing green light and reflecting blue light." O'Connor also describes a color switch (44) of Figure 2 that "may ideally pass red light, and switch between passing either green and/or blue light." Additionally, O'Connor describes a color switch (16) of Figure 3 that phase retards red

and blue light when passing the red and blue light, and passes green light without phase retarding the green light.

However, O'Connor does not describe transmitting a first spectral component of light, avoiding transmission of a complementary range of the first spectral component, and controllably switching a wavelength of the at least one first spectral component and the complementary spectral range of the at least one first spectral component. In contrast, O'Connor merely describes that the color switch (16) of Figure 1 always transmits red light (i.e., red light is never switched, at all) and switches between passing/reflecting green and blue light and that the color switch (44) of Figure 2 always transmits red light and switches between passing either green and/or blue light."

With respect to claim 26, the prior art of record does not explicitly disclose or render obvious an image projection unit comprising: an image generation element arrangement configured to produce an image by using the primary illumination light or a derivative of the primary illumination light and to thereby generate secondary illumination light, the image generation element arrangement comprising a reflective electronic color switch that is configured to reflect a first color so as to have a turned polarization state to reflect light having a color different from the first color in an unchanged polarization state, and to controllably switch a wavelength of the first color.

The closest prior art of record, O'Connor, describes a color switch (16) of Figure 1 that "may ideally pass red light through, for example, and selectably switch or alternate between either passing blue light and reflecting green light or passing green light and

reflecting blue light." O'Connor also describes a color switch (44) of Figure 2 that "may ideally pass red light, and switch between passing either green and/or blue light." Additionally, O'Connor describes a color switch (16) of Figure 3 that phase retards red and blue light when passing the red and blue light, and passes green light without phase retarding the green light.

However, O'Connor does not teach or suggest "a reflective electronic color switch that is configured to reflect a first color so as to have a turned polarization state, to reflect light having a color different from the first color in an unchanged polarization state, and to controllably switch a wavelength of the first color," as recited by amended Claim 26.

With respect to claims 14-19,21-23, 25 and 27, claims 14-19,21-23, 25 and 27 are allowable as they depend from allowed claims.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
